Notes

1. All server editions support open file backup if using Windows Server 2003 or 2008 with Volume Shadow Service enabled, if not the Open File Manger option is required
2. SBS Edition SQL and Exchange licenses can not be used on remote servers, must be used on Windows SBS server configured as Yosemite 'Master Server'
3. Library Expansion license is required for each additional drive configured in a robotic library device (either physical or Virtual Tape Library)
4. D2D2Ne enables policy driven movement of data between VTL backup and other devices, it is licensed once per 'Storage Domain'
5. Bare Metal Disaster Recovery is only configurable on servers with tape drives attached
6. Desktop and Workgroup Editions are not available with Yosemite Care (1 Years Support and Upgrade Protection), the customer must purchase new versions as and when available
7. All the Servers must all be configured in one Yosemite Backup 'Storage Domain' for Unlimited Edition licenses to be applicable
8. A 'Storage Domain' is created when a Master Server is installed and refers to all Yosemite Backup 'objects' (Client & Media Servers etc) that are added to the database controlled by that Master Server. Multiple Master Servers may be installed on the same network. Master Servers are managed via a GUI that can be run from any Windows or Linux desktop with a network connectivity to that server.
